Motivation

White noise: $\xi = (\xi(x))_{x \in \mathbb{R}^2} \stackrel{\text{i.i.d.}}{\sim} N(0, *)$: The most basic but wild random field
 ξ : Gaussian random field, $\mathbb{E}[\xi(x)] = 0$, $\mathbb{E}[\xi(x)\xi(y)] = \delta(x - y)$
 $\mathbb{P}(x \mapsto \xi(x) \in C_{loc}^{-1-\epsilon}) = 1$

The Schrödinger operator: $-\Delta + V$: self-adjoint on $L^2(\mathbb{R}^2) \rightarrow$ Spectral Analysis
closure of the op. on $C_0^\infty(\mathbb{R}^2)$

$$\begin{array}{c} \uparrow \\ \parallel \\ -c(|x|^2 + 1) \leq V(x) \in L^2_{loc}(\mathbb{R}^2) \end{array}$$

Claim: Realize $-\Delta + \xi$ as a self-adjoint operator

Other dimensions

$\xi = (\xi(x))_{x \in \mathbb{R}^d}$: White noise on $\mathbb{R}^d \Rightarrow "x \mapsto \xi(x)" \in C_{loc}^{-d/2-\epsilon}$

$d = 1 \Rightarrow W^{1,2}([a, b]) \ni f, g \mapsto \int_a^b (f'g' + \xi_{C_{loc}^{-1/2-\epsilon}} fg) dx$: well-defined

$-\Delta + \xi$ is realized as a self-adjoint operator

M. Fukushima and S. Nakao (1977) Spectral asymptotics
(Asymptotics of the Integrated density of states)

N. Minami (1988) (1989) Self-adj. on \mathbb{R} , Exp.Loc ($\xi \rightarrow \partial(\text{Lévy process})$)

$d \geq 4 \Rightarrow$ No results

$d = 2, 3$ are studied recently

$d = 2$ is easier than $d = 3$

$\xi \in C_{loc}^{-1-\epsilon}$ $\xi \in C_{loc}^{-3/2-\epsilon}$

$-\Delta + \lim_{\varepsilon \rightarrow 0} (\xi_\varepsilon(x) - c_\varepsilon)$ on \mathbb{R}^2 , where $\xi_\varepsilon(x) = (e^{\varepsilon^2 \Delta} \xi)(x)$

Self-adjointness

Spectral set = \mathbb{R}

Singular SPDEs

Random Schrödinger operators

Strengthen the relation

We should remark $\|\xi\|_{C^{-1-\epsilon}(\{|x| < R\})} \lesssim (\log R)^2$

Tools: Paracontrolled calculus by Heat semigroup referring Mouzard (2020)
and the partition of unity

The Besov Spaces

$\mathcal{C}^\alpha(\mathbb{R}^2) = \mathcal{B}_{\infty,\infty}^\alpha(\mathbb{R}^2)$: the Besov α -Hölder space

$\mathcal{H}^\alpha(\mathbb{R}^2) = \mathcal{W}^{\alpha,2}(\mathbb{R}^2) = \mathcal{B}_{2,2}^\alpha(\mathbb{R}^2)$: the Sobolev space with the index α .

Generalization by heat semigroup approach: $0 << b \in 2\mathbb{Z}$ fixed

For $p, q \in [1, \infty]$, $\alpha \in (-2b, 2b)$, $\mathcal{B}_{p,q}^\alpha(\mathbb{R}^2) = \overline{C_0^\infty(\mathbb{R}^2)}^{\|\cdot\|_{\mathcal{B}_{p,q}^\alpha(\mathbb{R}^2)}}$

$$\begin{aligned} \|f\|_{\mathcal{B}_{p,q}^\alpha(\mathbb{R}^2)} &:= \|e^\Delta f\|_{L^p(\mathbb{R}^2:dx)} \\ &\quad + \sup\left\{\|t^{-\alpha/2}\|Q_t f\|_{L^p(\mathbb{R}^2:dx)}\|_{L^q([0,1]:t^{-1}dt)} : Q \in StGC^{(|\alpha|, 2b]}\right\} \end{aligned}$$

$$StGC^k = \left\{ \left((\sqrt{t}\nabla)^\alpha \sum_{j=0}^{c-1} \frac{(-t\Delta)^j}{j!} e^{t\Delta} \right)_{t \in (0,1]} : \alpha \in \mathbb{Z}_+^2, \alpha_1 + \alpha_2 = k, 1 \leq c \leq b \right\}$$
$$=: P_t^{(c)}$$

Standard families of Gaussian operators with cancellation of order k .

Paraproducts

$$fg = - \int_0^1 dt \partial_t \{ P_t^{(b)} ((P_t^{(b)} f)(P_t^{(b)} g)) \} + P_1^{(b)} ((P_1^{(b)} f)(P_1^{(b)} g)) \because P_0^{(b)} = I$$

$= P_f g + \Pi(f, g) + P_g f$

$P_f g := \sum_{\nu} c_{\nu} \int_0^1 \frac{dt}{t} Q_t^{1,\nu} ((P_t^{\nu} f)(Q_t^{2,\nu} g))$: paraproduct term

$\Pi(f, g) := \sum_{\mu} c_{\mu} \int_0^1 \frac{dt}{t} P_t^{\mu} ((Q_t^{1,\mu} f)(Q_t^{2,\mu} g))$: resonating term

$$P^{\nu}, P^{\mu} \in StGC^{[0,b/2]}, Q^{1,\nu}, Q^{2,\nu}, Q^{1,\mu}, Q^{2,\mu} \in StGC^{[b/2,2b]}$$

$\{\chi_a\}_{a \in \mathbb{Z}^2} \subset C^{\infty}(\mathbb{R}^2 \rightarrow [0, 1])$ s.t. $\sum_{a \in \mathbb{Z}^2} \chi_a^2 \equiv 1$, $\text{supp } \chi_a \subset \Lambda_2(a) := a + (-1, 1)^2$

$$\chi_a(\cdot) = \chi_0(\cdot - a)$$

The continuity of paraproducts

(i) For any $\alpha \in \mathbb{R}$ and $\epsilon \in (0, 1)$,

$$\begin{aligned} & \|\chi_{a_1} P_{\chi_{a_2} g} (\chi_{a_3} f)\|_{\mathcal{H}^{\alpha-\epsilon}(\mathbb{R}^2)} \\ & \leq \begin{cases} C_{\alpha, \epsilon} \|\chi_{a_3} f\|_{\mathcal{H}^\alpha(\mathbb{R}^2)} \|\chi_{a_2} g\|_{L^\infty(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) \\ C_{\alpha, \epsilon} \|\chi_{a_3} f\|_{C^\alpha(\mathbb{R}^2)} \|\chi_{a_2} g\|_{L^2(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) \end{cases} \end{aligned}$$

(ii) For any $\alpha \in (-\infty, 0)$ and $\beta \in \mathbb{R}$,

$$\begin{aligned} & \|\chi_{a_1} P_{\chi_{a_2} f} (\chi_{a_3} g)\|_{\mathcal{H}^{\alpha+\beta}(\mathbb{R}^2)} \\ & \leq \begin{cases} C_{\alpha, \beta} \|\chi_{a_2} f\|_{C^\alpha(\mathbb{R}^2)} \|\chi_{a_3} g\|_{\mathcal{H}^\beta(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) \\ C_{\alpha, \beta} \|\chi_{a_2} f\|_{\mathcal{H}^\alpha(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\beta(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) \end{cases} \end{aligned}$$

(iii) For any $\alpha, \beta \in \mathbb{R}$ such that $\alpha + \beta > 0$,

$$\begin{aligned} & \|\chi_{a_1} \Pi(\chi_{a_2} f, \chi_{a_3} g)\|_{\mathcal{H}^{\alpha+\beta}(\mathbb{R}^2)} \\ & \leq C_{\alpha, \beta} \|\chi_{a_2} f\|_{\mathcal{H}^\alpha(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\beta(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)). \end{aligned}$$

1st ansatz for the definition of the operator

$$\|\chi_a \xi\|_{C^{-1-\epsilon}(\mathbb{R}^2)} \leq C_{\epsilon,\xi} (\log(2 + |a|))^2$$

$$u, H^\xi u := -\Delta u + \xi u \in L^2(\mathbb{R}^2) \Rightarrow \Delta u \in \mathcal{H}^{-1-\epsilon}(\mathbb{R}^2) \Rightarrow u \in \mathcal{H}^{1-\epsilon}(\mathbb{R}^2)$$

$$\mathcal{H}^{1-\epsilon}(\mathbb{R}^2) \ni u \mapsto \xi u$$

$$= \underbrace{\frac{P_u \xi}{\mathcal{H}_{loc}^{-1-\epsilon}}}_{\uparrow} + \underbrace{\frac{P_\xi u}{\mathcal{H}_{loc}^{(-1-\epsilon)+(1-\epsilon)=-2\epsilon}}}_{\text{ill defined}} + \underbrace{\Pi(u, \xi)}_{\mathcal{H}_{loc}^\infty} + \underbrace{P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} \xi))}_{\mathcal{H}_{loc}^\infty}$$

To erase this singularity, $-\Delta u = -P_u \xi + e^\Delta P_u \xi - \Delta u^{(\#)}$

Ansatz I: $u = \Delta^{-loc} P_u \xi + u^{(\#)}$ with $u^{(\#)} \in \mathcal{H}^{2(1-\epsilon)}(\mathbb{R}^2)$,

and $\|\chi_a u\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)}$, $\|\chi_a u^{(\#)}\|_{\mathcal{H}^{2(1-\epsilon)}(\mathbb{R}^2)}$ decays sufficiently fast as $|a| \rightarrow \infty$

where $\Delta^{-loc} := - \int_0^1 dt e^{t\Delta}$ satisfying $\Delta^{-loc} \Delta = \Delta \Delta^{-loc} = I - e^\Delta$

$$\|\chi_{a_1} \Delta^{-loc} \chi_{a_2} f\|_{C^\alpha(\mathbb{R}^2)} \leq C_{\alpha,\epsilon} \|\chi_{a_2} f\|_{C^{\alpha+\epsilon-2}(\mathbb{R}^2)} \exp(-C|a_1 - a_2|^2)$$

$$\|\chi_{a_1} \Delta^{-loc} \chi_{a_2} f\|_{\mathcal{H}^\alpha(\mathbb{R}^2)} \leq C_{\alpha,\epsilon} \|\chi_{a_2} f\|_{\mathcal{H}^{\alpha+\epsilon-2}(\mathbb{R}^2)} \exp(-C|a_1 - a_2|^2)$$

Commutators

Then $H^\xi u := -\Delta u + \xi u$

$$= -\frac{\Delta u^{(\#)}}{\in \mathcal{H}^{-2\epsilon}} + \frac{P_\xi(\Delta^{-loc} P_u \xi)}{\in \mathcal{H}^{(-1-\epsilon)+(1-2\epsilon)=-3\epsilon}} + \frac{\Pi(\Delta^{-loc} P_u \xi, \xi)}{\text{ill defined}} + (L^2)$$

Move the function u to outer places in the 2nd and 3rd terms
by the commutators

$$C(f, g, h) := \Pi(\Delta^{-loc} P_f g, h) - f \Pi(\Delta^{-loc} g, h)$$

$$S(f, g, h) := P_h(\Delta^{-loc} P_f g) - {}_f P_h(\Delta^{-loc} g)$$

where ${}_f P_h g := \sum_\nu c_\nu \int_0^1 \frac{dt}{t} Q_t^{1,\nu} ((P_t^\nu h)(Q_t^{2,\nu} g)f)$

The continuity of commutators and so on

(i) For any $\epsilon, \alpha \in (0, 1)$, $\beta \in \mathbb{R}$, $\gamma \in (-\infty, 0)$ such that $\beta + \gamma < 0$ and $\alpha + \beta + \gamma > 0$,

$$\begin{aligned} & \left\| \chi_{a_1} C(\chi_{a_2} f, \chi_{a_3} g, \chi_{a_4} h) \right\|_{\mathcal{H}^{\alpha+\beta+\gamma-\epsilon}(\mathbb{R}^2)} \\ & \left\| \chi_{a_1} S(\chi_{a_2} f, \chi_{a_3} g, \chi_{a_4} h) \right\|_{\mathcal{H}^{\alpha+\beta+\gamma-\epsilon}(\mathbb{R}^2)} \\ & \leq C_{\epsilon, \alpha, \beta, \gamma} \|\chi_{a_2} f\|_{\mathcal{H}^\alpha(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^{\beta-2}(\mathbb{R}^2)} \|\chi_{a_4} h\|_{C^\gamma(\mathbb{R}^2)} \\ & \quad \times \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2 + |a_1 - a_4|^2)) \end{aligned}$$

(ii) For any $\alpha \in (-\infty, 0)$, $\beta \in \mathbb{R}$ and $\epsilon \in (0, 1)$,

$$\begin{aligned} & \|\chi_{a_1} \chi_{a_2} h P_{\chi_{a_3} f} (\chi_{a_4} g)\|_{\mathcal{H}^{\alpha+\beta-\epsilon}(\mathbb{R}^2)} \\ & \leq C_{\alpha, \beta, \epsilon} \|\chi_{a_3} f\|_{C^\alpha(\mathbb{R}^2)} \|\chi_{a_4} g\|_{C^\beta(\mathbb{R}^2)} \|\chi_{a_2} h\|_{L^2(\mathbb{R}^2)} \\ & \quad \times \exp(-C(|a_1 - a_2|^2 + |a_2 - a_3|^2 + |a_2 - a_4|^2)) \end{aligned}$$

Modification

$$\text{Then } H^\xi u = -\frac{\Delta u^{(\#)}}{\in \mathcal{H}^{-2\epsilon}} + \frac{u P_\xi(\Delta^{-loc} \xi)}{\in \mathcal{H}^{(-1-\epsilon)+(1-\epsilon)-2\epsilon=-4\epsilon}} + u \underbrace{\Pi(\Delta^{-loc} \xi, \xi)}_{\text{ill defined}} + (L^2)$$

Replace the ill defined term by a $\bigcap_{\epsilon > 0} C_{loc}^{-\epsilon}(\mathbb{R}^2)$ -valued random variable Y_ξ s.t.
 $\lim_{\varepsilon \rightarrow 0} \mathbb{E}[\|\chi_a(Y_{\xi_\varepsilon} - Y_\xi)\|_{C^{-\epsilon}(\mathbb{R}^2)}^p] = 0$ for any $a \in \mathbb{Z}^2$, $p \in [1, \infty)$ and $\epsilon > 0$, where

$$Y_{\xi_\varepsilon} := \Pi(\Delta^{-loc} \xi_\varepsilon, \xi_\varepsilon) - \underline{\mathbb{E}[\Pi(\Delta^{-loc} \xi_\varepsilon, \xi_\varepsilon)]}$$

$\xi_\varepsilon := e^{\varepsilon^2 \Delta} \xi$ is a smooth approximation of ξ ↗ diverge as $\varepsilon \rightarrow 0$

$$\|\chi_a Y_\xi\|_{C^{-\epsilon}(\mathbb{R}^2)} \leq C_{\epsilon, \xi} \log(2 + |a|)$$

Here the operator H^ξ is replaced by a new operator which we denote as \widetilde{H}^ξ

2nd ansatz

$$\widetilde{H}^\xi u = -\Delta u^{(\#)} + \frac{{}_u P_\xi(\Delta^{-loc} \xi)}{\in \mathcal{H}^{-4\epsilon}} + \frac{P_u Y_\xi}{\in \mathcal{H}^{-2\epsilon}} + (L^2)$$

To erase these singularities,

$$\text{Ansatz II: } u^{(\#)} = \Delta^{-loc}({}_u P_\xi(\Delta^{-loc} \xi) + P_u Y_\xi) + u^\#$$

with $u^\# \in \mathcal{H}^2(\mathbb{R}^2)$ and $\|\chi_a u^\#\|_{\mathcal{H}^2(\mathbb{R}^2)}$ decays sufficiently fast as $|a| \rightarrow \infty$

$$\text{Then, since } -\Delta u^{(\#)} = -{}_u P_\xi(\Delta^{-loc} \xi) - P_u Y_\xi + \frac{e_u^\Delta {}_u P_\xi(\Delta^{-loc} \xi) + e^\Delta P_u Y_\xi - \Delta u^\#}{\in L^2},$$

$$\widetilde{H}^\xi u \in L^2$$

Our operator

$$\begin{aligned}\widetilde{H}^\xi u := & -\Delta \Phi_\xi(u) + P_\xi \Phi_\xi(u) + \Pi(\Phi_\xi(u), \xi) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} \xi)) \\ & + e^\Delta P_u \xi + e^\Delta {}_u P_\xi(\Delta^{-loc} \xi) + e^\Delta P_u Y_\xi \\ & + C(u, \xi, \xi) + S(u, \xi, \xi) \\ & + P_{Y_\xi} u + \Pi(u, Y_\xi) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} Y_\xi)) \\ & + P_\xi(\Delta^{-loc} {}_u P_\xi(\Delta^{-loc} \xi)) + \Pi(\Delta^{-loc} {}_u P_\xi(\Delta^{-loc} \xi), \xi) \\ & + P_\xi(\Delta^{-loc} P_u Y_\xi) + \Pi(\Delta^{-loc} P_u Y_\xi, \xi),\end{aligned}$$

$$\begin{aligned}\text{with } \Phi_\xi(u) := & u - \Delta^{-loc} P_u \xi - \Delta^{-loc} {}_u P_\xi(\Delta^{-loc} \xi) - \Delta^{-loc} P_u Y_\xi \\ = & u^\#\end{aligned}$$

Main Statements

$$\text{Dom}_0(\widetilde{H}^\xi) := \left\{ u \in \bigcap_{\epsilon > 0} \mathcal{H}^{1-\epsilon}(\mathbb{R}^2) : \limsup_{|a| \rightarrow \infty} \frac{1}{|a|} \log \|\chi_a u\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} < 0 \text{ for any } \epsilon > 0, \right. \\ \left. \Phi_\xi(u) \in \mathcal{H}^2(\mathbb{R}^2), \limsup_{|a| \rightarrow \infty} \frac{1}{|a|} \log \|\chi_a \Phi_\xi(u)\|_{\mathcal{H}^2(\mathbb{R}^2)} < 0 \right\}$$

Theorem (Self-adjointness)

The operator \widetilde{H}^ξ with the domain $\text{Dom}_0(\widetilde{H}^\xi)$ is essentially self-adjoint on $L^2(\mathbb{R}^2)$.

Theorem (Spectrum)

The spectral set of the closure $\overline{\widetilde{H}^\xi}$ is \mathbb{R} .

Characteristic points of our operators

$$\widetilde{H^{\xi_\varepsilon}} = -\Delta + \xi_\varepsilon - \mathbb{E}[\Pi(\Delta^{-loc}\xi_\varepsilon, \xi_\varepsilon)]$$

: essentially self-adjoint on $C_0^\infty(\mathbb{R}^2)$ since $|\xi_\varepsilon(x)| \leq C_{\xi, \varepsilon}(\log(2 + |x|))^2$
smooth

However $C_0^\infty(\mathbb{R}^2) \not\subset \text{Dom}_0(\widetilde{H^\xi})$ since $\Phi_\xi(C_0^\infty(\mathbb{R}^2)) \not\subset \mathcal{H}^2(\mathbb{R}^2)$

Our powerful tool is

$$\begin{aligned} \Phi_\xi^s(u) := u &- \sum_{a \in \mathbb{Z}^2} \Delta^{-loc} P_u^{s(a)}(\chi_a^2 \xi) - \sum_{a, a' \in \mathbb{Z}^2} \Delta^{-loc} {}_u P_{\chi_a^2 \xi}^{s_1(a, a')} (\Delta^{-loc} \chi_{a'}^2 \xi) \\ &- \sum_{a \in \mathbb{Z}^2} \Delta^{-loc} P_u^{s_2(a)}(\chi_a^2 Y_\xi) \end{aligned}$$

$$P_f^s g := \sum_{\nu} c_\nu \int_0^s \frac{dt}{t} Q_t^{1,\nu}((P_t^\nu f)(Q_t^{2,\nu} g))$$

$${}_h P_f^s g := \sum_{\nu} c_\nu \int_0^s \frac{dt}{t} Q_t^{1,\nu}((P_t^\nu f)(Q_t^{2,\nu} g) h)$$

The continuity of restricted paraproducts

(i) For any $\beta < \gamma$,

$$\begin{aligned} & \|\chi_{a_1} P_{\chi_{a_2} f}^s (\chi_{a_3} g)\|_{\mathcal{H}^\beta(\mathbb{R}^2)} \\ & \leq C_{\beta, \gamma} s^{(\gamma - \beta)/2} \|\chi_{a_2} f\|_{L^2(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\gamma(\mathbb{R}^2)} \\ & \quad \times \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) \end{aligned}$$

(ii) For any $\beta, \gamma_1, \gamma_2 \in \mathbb{R}$ satisfying $\gamma_1 \leq 0$ and $\beta < \gamma_1 + \gamma_2$,

$$\begin{aligned} & \|\chi_{a_1} \chi_{a_2} h P_{\chi_{a_3} f}^s (\chi_{a_4} g)\|_{\mathcal{H}^\beta(\mathbb{R}^2)} \\ & \leq C_{\beta, \gamma_1, \gamma_2} s^{(\gamma_1 + \gamma_2 - \beta)/2} \|\chi_{a_3} f\|_{C^{\gamma_1}(\mathbb{R}^2)} \|\chi_{a_4} g\|_{C^{\gamma_2}(\mathbb{R}^2)} \|\chi_{a_2} h\|_{L^2(\mathbb{R}^2)} \\ & \quad \times \exp(-C(|a_1 - a_2|^2 + |a_2 - a_3|^2 + |a_2 - a_4|^2)) \end{aligned}$$

Choice of s

For any $\epsilon \in (0, 1)$ and almost all ξ , there exist $s(\epsilon, \xi), s_1(\epsilon, \xi), s_2(\epsilon, \xi) \in (0, 1)$ and $M, M(\epsilon), M_1(\epsilon), M_2(\epsilon) \in (0, \infty)$ s.t.

$$\|\chi_a(I - \Phi_\xi^{s(\epsilon, \xi, \delta)})(u)\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} \leq \delta \sum_{a' \in \mathbb{Z}^2} \exp(-M|a - a'|^2) \|\chi_{a'} u\|_{L^2(\mathbb{R}^2)}$$

for any $\delta \geq 0$, where $s(\epsilon, \xi, \delta) = (s(a; \epsilon, \xi, \delta), s_1(a, a'; \epsilon, \xi, \delta), s_2(a; \epsilon, \xi, \delta))_{a \in \mathbb{Z}^2}$ is

$$s(a; \epsilon, \xi, \delta) = s(\epsilon, \xi) \left(\frac{\delta}{(\log(2 + |a|))^2} \right)^{M(\epsilon)},$$

$$s_1(a, a'; \epsilon, \xi, \delta) = s_1(\epsilon, \xi) \left(\frac{\delta}{(\log(2 + |a|))^2 (\log(2 + |a'|))^2} \right)^{M_1(\epsilon)}$$

$$s_2(a; \epsilon, \xi, \delta) = s_2(\epsilon, \xi) \left(\frac{\delta}{\log(2 + |a|)} \right)^{M_2(\epsilon)}.$$

Inverse of Φ_ξ^s

$$\|(I - \Phi_\xi^{s(\epsilon, \xi, \delta)})(u)\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} \leq C_{\xi, \epsilon} \delta \|u\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)}$$

Thus for $\delta \in (0, 1/C_{\xi, \epsilon})$, there exists the inverse $(\Phi_\xi^{s(\epsilon, \xi, \delta)})^{-1} = \sum_{n=0}^{\infty} (I - \Phi_\xi^{s(\epsilon, \xi, \delta)})^n$
s.t. $\|(\Phi_\xi^{s(\epsilon, \xi, \delta)})^{-1}(v)\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} \leq \|v\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} / (1 - C_{\xi, \epsilon} \delta)$

$(\Phi_\xi^{s(\epsilon, \xi, \delta)})^{-1}(\{v \in \mathcal{H}^2(\mathbb{R}^2) : \text{supp } v \text{ is compact}\}) \subset \text{Dom}_0(\widetilde{H}^\xi)$

since $\Phi_\xi - \Phi_\xi^{s(\epsilon, \xi, \delta)}$ is good.

The continuity of the difference of paraproducts

$$\begin{aligned} & \|\chi_{a_1}(P_{\chi_{a_2} f}(\chi_{a_3} g) - P_{\chi_{a_2} f}^s(\chi_{a_3} g))\|_{\mathcal{H}^\beta(\mathbb{R}^2)} \\ & \leq \begin{cases} \frac{C_{\beta,\gamma}}{s^{(\beta-\gamma)/2}} \|\chi_{a_2} f\|_{L^2(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\gamma(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) & \text{if } \beta > \gamma, \\ C_{\beta,\gamma} \left(\log \frac{1}{s} \right) \|\chi_{a_2} f\|_{L^2(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\gamma(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) & \text{if } \beta = \gamma, \\ C_{\beta,\gamma} \|\chi_{a_2} f\|_{L^2(\mathbb{R}^2)} \|\chi_{a_3} g\|_{C^\gamma(\mathbb{R}^2)} \exp(-C(|a_1 - a_2|^2 + |a_1 - a_3|^2)) & \text{if } \beta < \gamma \end{cases} \end{aligned}$$

$$\begin{aligned} & \|\chi_{a_1}(\chi_{a_2} h P_{\chi_{a_3} f}(\chi_{a_4} g) - \chi_{a_2} h P_{\chi_{a_3} f}^s(\chi_{a_4} g))\|_{\mathcal{H}^\beta(\mathbb{R}^2)} \\ & \leq \begin{cases} \frac{C_{\beta,\gamma_1,\gamma_2}}{s^{(\beta-\gamma_1-\gamma_2)/2}} \|\chi_{a_3} f\|_{C^{\gamma_1}(\mathbb{R}^2)} \|\chi_{a_4} g\|_{C^{\gamma_2}(\mathbb{R}^2)} \|\chi_{a_2} h\|_{L^2(\mathbb{R}^2)} \\ \quad \times \exp(-C(|a_1 - a_2|^2 + |a_2 - a_3|^2 + |a_2 - a_4|^2)) & \text{if } \beta > \gamma_1 + \gamma_2, \gamma_1 \leq 0, \\ C_{\beta,\gamma_1,\gamma_2} \left(\log \frac{1}{s} \right) \|\chi_{a_3} f\|_{C^{\gamma_1}(\mathbb{R}^2)} \|\chi_{a_4} g\|_{C^{\gamma_2}(\mathbb{R}^2)} \|\chi_{a_2} h\|_{L^2(\mathbb{R}^2)} \\ \quad \times \exp(-C(|a_1 - a_2|^2 + |a_2 - a_3|^2 + |a_2 - a_4|^2)) & \text{if } \beta = \gamma_1 + \gamma_2, \gamma_1 \leq 0, \\ C_{\beta,\gamma_1,\gamma_2} \|\chi_{a_3} f\|_{C^{\gamma_1}(\mathbb{R}^2)} \|\chi_{a_4} g\|_{C^{\gamma_2}(\mathbb{R}^2)} \|\chi_{a_2} h\|_{L^2(\mathbb{R}^2)} \\ \quad \times \exp(-C(|a_1 - a_2|^2 + |a_2 - a_3|^2 + |a_2 - a_4|^2)) & \text{if } \beta < \gamma_1 + \gamma_2, \gamma_1 \leq 0. \end{cases} \end{aligned}$$

For the self-adjointness

\widetilde{H}^ξ : essentially self-adjoint $\Leftrightarrow \overline{\text{Ran}(\tilde{H}^\xi + i)} = L^2(\mathbb{R}^2)$

we can take as a real number for operators bounded below

Thus we first restrict the randomness to consider an operator \widetilde{H}_R^ξ bounded below.
This is the limit as $\varepsilon \rightarrow 0$ of

$$\widetilde{H}_R^{\xi_\varepsilon} = -\Delta + \xi_{\varepsilon,R} - \mathbb{E}[\Pi(\Delta^{-loc}\xi_{\varepsilon,R}, \xi_{\varepsilon,R})],$$

where $\xi_R = \sum_{a \in \mathbb{Z}^2 \cap \Lambda_R} \chi_a^2 \xi$, $\xi_{\varepsilon,R} = \sum_{a \in \mathbb{Z}^2 \cap \Lambda_R} \chi_a^2 e^{\varepsilon^2 \Delta} \xi$.

The exact definition of \widetilde{H}_R^ξ is in the next slide.

Restricted randomness

$$\begin{aligned}\widetilde{H}_R^\xi u = & -\Delta \Phi_{\xi,R}(u) + P_{\xi_R} \Phi_{\xi,R}(u) + \Pi(\Phi_{\xi,R}(u), \xi_R) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} \xi_R)) \\ & + e^\Delta P_u \xi_R + e^\Delta {}_u P_{\xi_R} (\Delta^{-loc} \xi_R) + e^\Delta P_u Y_{\xi,R} + C(u, \xi_R, \xi_R) \\ & + S(u, \xi_R, \xi_R) + P_{Y_{\xi,R}} u + \Pi(u, Y_{\xi,R}) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} Y_{\xi,R})) \\ & + P_{\xi_R} (\Delta^{-loc} {}_u P_{\xi_R} (\Delta^{-loc} \xi_R)) + \Pi(\Delta^{-loc} {}_u P_{\xi_R} (\Delta^{-loc} \xi_R), \xi_R) \\ & + P_{\xi_R} (\Delta^{-loc} P_u Y_{\xi,R}) + \Pi(\Delta^{-loc} P_u Y_{\xi,R}, \xi_R),\end{aligned}$$

$$\begin{aligned}\Phi_{\xi,R}(u) &= u - \Delta^{-loc} P_u \xi_R - \Delta^{-loc} {}_u P_{\xi_R} (\Delta^{-loc} \xi_R) - \Delta^{-loc} P_u Y_{\xi,R} \\ Y_{\xi,R} &= \lim_{\varepsilon \rightarrow 0} \left(\Pi(\Delta^{-loc} \xi_{\varepsilon,R}, \xi_{\varepsilon,R}) - \frac{\mathbb{E}[\Pi(\Delta^{-loc} \xi_{\varepsilon,R}, \xi_{\varepsilon,R})]}{\mathbb{E}[\Pi(\Delta^{-loc} \xi_{\varepsilon,R}, \xi_{\varepsilon,R})]} \right) \\ &\neq \mathbb{E}[\Pi(\Delta^{-loc} \xi_{\varepsilon,R}, \xi_{\varepsilon,R})] \Rightarrow \widetilde{H}_R^\xi \neq \widetilde{H}_{\xi,R}^\xi\end{aligned}$$

$$\text{Dom}(\widetilde{H}_R^\xi) := \left\{ u \in \bigcap_{\epsilon > 0} \mathcal{H}^{1-\epsilon}(\mathbb{R}^2) : \Phi_{\xi,R}(u) \in \mathcal{H}^2(\mathbb{R}^2) \right\}$$

Properties of the operator with the restricted randomness

$$\|\nabla \Phi_{\xi,R}(u)\|_{L^2(\mathbb{R}^2)}^2 \leq (u, (\widetilde{H}_R^\xi + k(\xi, R))u)_{L^2(\mathbb{R}^2)}$$

We can show that $\text{Ran}(\widetilde{H}_R^\xi + k(\xi, R)) = L^2(\mathbb{R}^2)$

Lemma (Self-adjointness of the restricted randomness)

The operator \widetilde{H}_R^ξ with the domain $\text{Dom}(\widetilde{H}_R^\xi)$ is self-adjoint on $L^2(\mathbb{R}^2)$.

Proof of the self-adjointness

For $\forall f \in \text{Ran}(\widetilde{H^\xi} + i)^\perp$,

$$\|f\|_{L^2(\mathbb{R}^2)}^2 = \lim_{R \rightarrow \infty} (f, \widetilde{\chi_R} f)_{L^2(\mathbb{R}^2)},$$

where $\widetilde{\chi_R} \in \widetilde{C_0^\infty}(\Lambda_R \rightarrow [0, 1])$ s.t. $\widetilde{\chi_R} = 1$ on Λ_{R-1} .

$$\varphi_{R,L} := (\widetilde{H_{R+L}^\xi} + i)^{-1} \widetilde{\chi_R} f \in \text{Dom}(\widetilde{H_{R+L}^\xi})$$

We can show that $\widetilde{\varphi_{R,L}} := (\Phi_\xi^{s(\epsilon, \xi, \delta)})^{-1}(\Phi_{\xi, R+L}^{s(\epsilon, \xi, \delta)}(\varphi_{R,L})) \in \text{Dom}_0(\widetilde{H^\xi})$

Since $\widetilde{\chi_R} f = (\widetilde{H_{R+L}^\xi} + i) \varphi_{R,L}$ and $(\widetilde{H^\xi} + i) \widetilde{\varphi_{R,L}} \in \text{Ran}(\widetilde{H^\xi} + i)$, we have

$$\|f\|_{L^2(\mathbb{R}^2)}^2 = \lim_{R \rightarrow \infty} (f, (\underbrace{(\widetilde{H_{R+L}^\xi} + i) \varphi_{R,L} - (\widetilde{H^\xi} + i) \widetilde{\varphi_{R,L}}}_{\downarrow 0 \text{ as } L \rightarrow \infty})_{L^2(\mathbb{R}^2)}) = 0$$

$$\therefore \overline{\text{Ran}(\widetilde{H^\xi} + i)} = L^2(\mathbb{R}^2)$$

Resolvent convergence

For \widetilde{H}^ξ on $\mathbb{T}^2 = \mathbb{R}^2/\mathbb{Z}^2$,

$$\sup_{\|v\|_{L^2(\mathbb{T}^2)}=1} \|(\widetilde{H}^{\xi_\varepsilon} + z)^{-1} v - (\widetilde{H}^\xi + z)^{-1} v\|_{L^2(\mathbb{T}^2)} \xrightarrow{\varepsilon \rightarrow 0} 0 \text{ for a large } z \in \mathbb{R}$$

(Mouzard Prop.2.14)

$$\lambda_n(\widetilde{H}^{\xi_\varepsilon}) \xrightarrow{\varepsilon \rightarrow 0} \lambda_n(\widetilde{H}^\xi) \text{ (Mouzard Cor.2.15)}$$

For \widetilde{H}^ξ on \mathbb{R}^2 ,

$$\|(\widetilde{H}^{\xi_\varepsilon} + z)^{-1} v - (\widetilde{H}^\xi + z)^{-1} v\|_{L^2(\mathbb{R}^2)} \xrightarrow{\varepsilon \rightarrow 0} 0 \text{ for each } v \in L^2(\mathbb{R}^2) \text{ and } z \in \mathbb{C} \setminus \mathbb{R}$$

However the estimate with $\sup_{\|v\|_{L^2(\mathbb{R}^2)}=1}$ may be difficult.

Fourier series representation

For the identification of the spectrum, we take a positive probability event that $\xi \doteq \text{const}$ on Λ_L with a large L .

For this, identify Λ_L with $\mathbb{R}^2/(L\mathbb{Z})^2$ and represent the white noise ξ^L on Λ_L as

$$\xi^L(x) = \sum_{\mathbf{n} \in \mathbb{Z}^2} X_{\mathbf{n}}(\xi^L) \varphi_{\mathbf{n}}^L(x),$$

where $\{X_{\mathbf{n}}(\xi^L)\}_{\mathbf{n} \in \mathbb{Z}^2} \stackrel{\text{i.i.d.}}{\sim} N(0, 1)$ and $\{\varphi_{\mathbf{n}}^L\}_{\mathbf{n} \in \mathbb{Z}^2}$ is ONB of $L^2(\mathbb{R}^2/(L\mathbb{Z})^2)$ $\varphi_0^L \equiv 1/L$

defined by $\varphi_{(n_1, n_2)}^L(x_1, x_2) = \phi_{n_1}^L(x_1) \phi_{n_2}^L(x_2)$

$$\text{and } \phi_{n_1}^L(x_1) = \begin{cases} \sqrt{2/L} \cos(2\pi n_1 x_1 / L) & \text{for } 0 < n_1 \in \mathbb{Z}, \\ \sqrt{1/L} & \text{for } n_1 = 0, \\ \sqrt{2/L} \sin(2\pi n_1 x_1 / L) & \text{for } 0 > n_1 \in \mathbb{Z}. \end{cases}$$

Decomposition by the Fourier series

Write $\xi = \widetilde{\chi_L} \xi_{N \geq}^L + \widetilde{\xi_{N <}^L}$, where

$$\xi_{N \geq}^L(x) = \sum_{n \in \mathbb{Z}^2 \cap \Lambda_N} X_n(\xi^L) \varphi_n^L(x),$$

$\widetilde{\xi_{N <}^L}$ is a Gaussian random field independent of $\xi_{N \geq}^L(x)$

Let $Y_{\xi, L, N <}$ be a $\bigcap_{\epsilon > 0} C_{loc}^{-\epsilon}(\mathbb{R}^2)$ -valued random variable such that

$$\lim_{\varepsilon \rightarrow 0} \mathbb{E}[\|\chi_a(Y_{\xi, \varepsilon, L, N <} - Y_{\xi, L, N <})\|_{C^{-\epsilon}(\mathbb{R}^2)}^p] = 0 \text{ for any } p \in [1, \infty), a \in \mathbb{Z}^2, \text{ where}$$

$$Y_{\xi, \varepsilon, L, N <} := \Pi(\Delta^{-loc} e^{\varepsilon^2 \Delta} \widetilde{\xi_{N <}^L}, e^{\varepsilon^2 \Delta} \widetilde{\xi_{N <}^L}) - \mathbb{E}[\Pi(\Delta^{-loc} e^{\varepsilon^2 \Delta} \widetilde{\xi_{N <}^L}, e^{\varepsilon^2 \Delta} \widetilde{\xi_{N <}^L})_\varepsilon]).$$

Operator depending only on $\widetilde{\xi_{N<}^L}$

$$\begin{aligned}
H^{\widetilde{\xi_{N<}^L}} u &= -\Delta \Phi_{\xi,L,N<} (u) + P_{\widetilde{\xi_{N<}^L}} \Phi_{\xi,L,N<} (u) + \Pi(\Phi_{\xi,L,N<} (u), \widetilde{\xi_{N<}^L}) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} \widetilde{\xi_{N<}^L})) \\
&\quad + e^\Delta P_u \widetilde{\xi_{N<}^L} + e^\Delta {}_u P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} \widetilde{\xi_{N<}^L}) + e^\Delta P_u Y_{\xi,L,N<} \\
&\quad + C(u, \widetilde{\xi_{N<}^L}, \widetilde{\xi_{N<}^L}) + S(u, \widetilde{\xi_{N<}^L}, \widetilde{\xi_{N<}^L}) \\
&\quad + P_{Y_{\xi,L,N<}} u + \Pi(u, Y_{\xi,L,N<}) + P_1^{(b)}((P_1^{(b)} u)(P_1^{(b)} Y_{\xi,L,N<})) \\
&\quad + P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} {}_u P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} \widetilde{\xi_{N<}^L}) + \Pi(\Delta^{-loc} {}_u P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} \widetilde{\xi_{N<}^L}), \widetilde{\xi_{N<}^L})) \\
&\quad + P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} P_u Y_{\xi,L,N<}) + \Pi(\Delta^{-loc} P_u Y_{\xi,L,N<}, \widetilde{\xi_{N<}^L}),
\end{aligned}$$

$$\Phi_{\xi,L,N<} (u) := u - \Delta^{-loc} P_u \widetilde{\xi_{N<}^L} - \Delta^{-loc} {}_u P_{\widetilde{\xi_{N<}^L}} (\Delta^{-loc} \widetilde{\xi_{N<}^L}) - \Delta^{-loc} P_u Y_{\xi,L,N<}$$

$$\text{Dom}_0(H^{\widetilde{\xi_{N<}^L}}) := \left\{ u \in \bigcap_{\epsilon > 0} \mathcal{H}^{1-\epsilon}(\mathbb{R}^2) : \limsup_{|a| \rightarrow \infty} \frac{1}{|a|} \log \|\chi_a u\|_{\mathcal{H}^{1-\epsilon}(\mathbb{R}^2)} < 0, \right.$$

$$\left. \Phi_{\xi,L,N<} (u) \in \mathcal{H}^2(\mathbb{R}^2), \limsup_{|a| \rightarrow \infty} \frac{1}{|a|} \log \|\chi_a \Phi_{\xi,L,N<} (u)\|_{\mathcal{H}^2(\mathbb{R}^2)} < 0 \right\}$$

Relations with the original operator

$$\text{Dom}_0(\widetilde{H}^\xi) = \text{Dom}_0(\widetilde{H^{\xi,L,N<}})$$

$$\widetilde{H}^\xi = \widetilde{H^{\xi,L,N<}} + \widetilde{\chi_L \xi_N^L} - Y^{L,N\geq},$$

where

$$Y^{L,N\geq} := \sum_{\mathbf{n} \in \mathbb{Z}^2 \cap \Lambda_N} \Pi(\Delta^{-loc} \widetilde{\chi_L \varphi_{\mathbf{n}}^L}, \widetilde{\chi_L \varphi_{\mathbf{n}}^L}).$$

$Y^{L,N\geq}$ may diverge as $N \rightarrow \infty$. However we have

$$\sup_{x \in \mathbb{R}^2} |Y^{L,N\geq}(x)| \leq c_\eta (N/L)^\eta \text{ for } \forall \eta.$$

For $1 < R < L/2$ and large N , we can take an event s.t. $\widetilde{H^{\xi,L,N<}} \doteq -\Delta$ on Λ_R .

For $\forall \varepsilon > 0$,

take $\varphi_{\varepsilon,R} \in C_0^\infty(\Lambda_R)$ s.t. $\|\varphi_{\varepsilon,R}\|_{L^2(\mathbb{R})} = 1$ and

$$\|((-\Delta - Y^{L,N \geq}) - \inf \text{spec}(-\Delta - Y^{L,N \geq})_{\Lambda_R}^{\text{Dirichlet}}) \varphi_{\varepsilon,R}\|_{L^2(\mathbb{R}^2)} < \varepsilon.$$

For $\forall \lambda \in \mathbb{R}$, $\|$

$$\|(-\Delta + r(\lambda, L, N, R) \varphi_0^L - Y^{L,N \geq}) - \lambda\|_{L^2(\mathbb{R}^2)} \text{ with } r(\lambda, L, N, R) \in \mathbb{R}$$

$\cdot \|.$

$$\|(\widetilde{H^\xi} - \lambda) \widetilde{\varphi_{\varepsilon,R}}\|_{L^2(\mathbb{R}^2)} \text{ for } \xi \in E(\varepsilon, \epsilon, \lambda, L) \text{ & } \widetilde{\varphi_{\varepsilon,L}} := (\Phi_{\xi,L,N<}^{s(\epsilon,\xi,L,\delta)})^{-1}(\varphi_{\varepsilon,R})$$

The event we consider

$E(\varepsilon, \epsilon, \lambda, L)$
= $\left\{ \xi : \text{In the representation } \xi = \widetilde{\chi_L} \xi_{N \geq}^L + \widetilde{\xi_{N <}^L} \text{ with } N = L^{10}, \text{ it holds that} \right.$
 $|X_0(\xi^L) - r(\lambda, L, N, R)|, |X_n(\xi^L)| \leq \varepsilon/N^2 \text{ for any } n \in \mathbb{Z}^2 \cap \Lambda_N \setminus \{\mathbf{0}\},$
 $\| \chi_a \widetilde{\xi_{N <}^L} \|_{C^{-1-\epsilon}(\mathbb{R}^2)}, \| \chi_a Y_{\xi, L, N <} \|_{C^{-\epsilon}(\mathbb{R}^2)} \leq 1_{\Lambda_{L/2}}(a)L^{-\epsilon} + 1_{\Lambda_{L/2}^c}(a)|a|^\epsilon$
 $\left. \text{for any } a \in \mathbb{Z}^2. \right\},$

which satisfies $\mathbb{P}(E(\varepsilon, \epsilon, \lambda, L)) > 0$.

Probability One

Let $E(x_0, \varepsilon, \epsilon, \lambda, L) := \{\xi : \xi(\cdot - x_0) \in E(\varepsilon, \epsilon, \lambda, L)\}$

Then $\bigcup_{x_0 \in \mathbb{Z}^2} E(x_0, \varepsilon, \epsilon, \lambda, L)$ is \mathbb{Z}^2 -invariant.

By the ergodicity of the white noise, we have

$$\mathbb{P}\left(\bigcup_{x_0 \in \mathbb{Z}^2} E(x_0, \varepsilon, \epsilon, \lambda, L)\right) = 1.$$

By the shift, we can take a Weyl sequence with probability 1.

Thus $\lambda \in \text{Spec}(\widetilde{H^\xi})$.
